

Watlington Air Quality

NO₂ Monitor at Town Hall

The Town Hall monitor records the average NO₂ concentration for each hour throughout the day as in indication of the level of air pollution. Unfortunately it developed a fault on 17 January so there has been no data since them. We are told that it will be possible to recover missing information from the machine at some later date. For what it is worth, the provisional monthly average for the first half of January was 26.5 µg/m³. The loss of the monitor throughout the period of the roadworks in town is very unfortunate, especially for the period that the traffic lights have been in place at the Town Hall.
